

Behavioral Training for Caregivers of Children with Prader-Willi Syndrome

Please share this flyer with anyone you know who may be interested in participating in this study

We are looking for research study participants! Help us learn about the effects of a behavioral caregiver training program for caregivers of children with PWS

Caregivers will participate in a 15-week caregiver training program, complete pre and post training surveys and testing, and collect child behavior data. Including pre-testing and post-testing, the study will take 18 weeks in total, and will require between 30 min - 2 hours per week. The training, testing, and surveys will be done entirely online.

Caregivers must be at least 18 years of age, must speak and read English, and live in the home with their child with PWS. Caregivers must be able to participate in an online program with both live and recorded sessions. Children must be aged 3-12, have a diagnosis of PWS and engage in at least one disruptive behavior. Examples of disruptive behavior include tantrums, hitting, picking at skin, and refusing to comply with necessary tasks. Children must have a caregiver who will also participate in the study.

Participants will be compensated with a \$250 gift card following the completion of the study.
